

# Hybrid quantum repeater with encoding

Nadja K. Bernardes\* and Peter van Loock

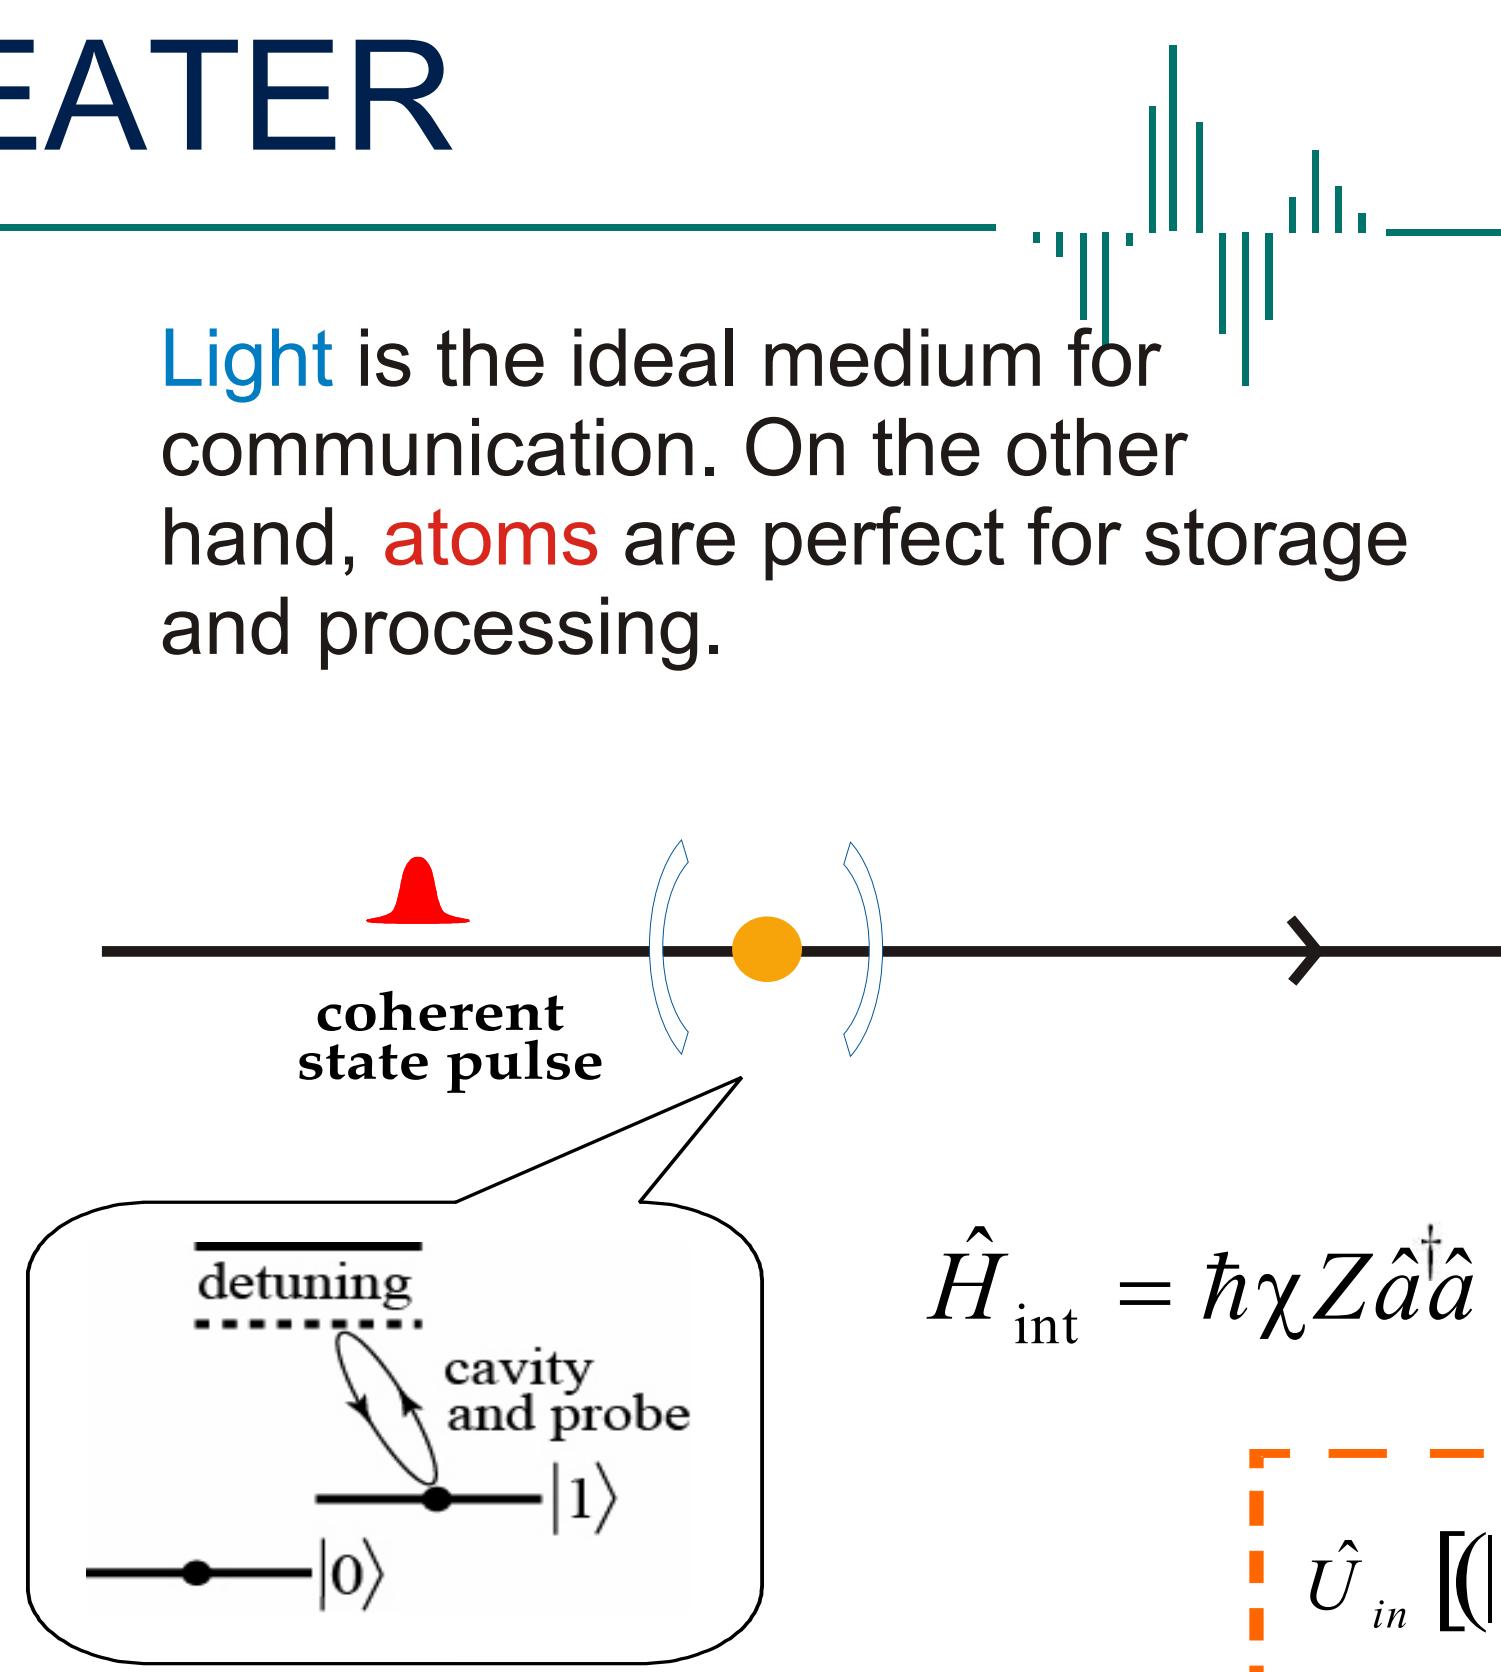

## HYBRID QUANTUM REPEATER

Entanglement is the universal resource for Quantum Information processing. Via a **quantum repeater** is possible to create long-distance entanglement.

Light is the ideal medium for communication. On the other hand, atoms are perfect for storage and processing.

Optical quantum information processing via the **hybrid approach**: utilize both discrete and continuous variables, Gaussian and non-Gaussian resources, "best of both worlds".

P. van Loock et al., PRL 96, 240501 (2006).

## ERROR MODELS

### 1. Imperfect generation of the entangled state

$$F|\phi^+\rangle\langle\phi^+| + (1-F)|\phi^-\rangle\langle\phi^-|$$

$$P_0 = 1 - (2F - 1)^{\eta/(1-\eta)} \quad (\text{Upper bound!})$$

$$\eta = e^{-t/L_{at}}$$

### 2. Errors in the CNOT gates

$$U_{ij} \rho U_{ij}^\dagger = \rho' \rightarrow$$

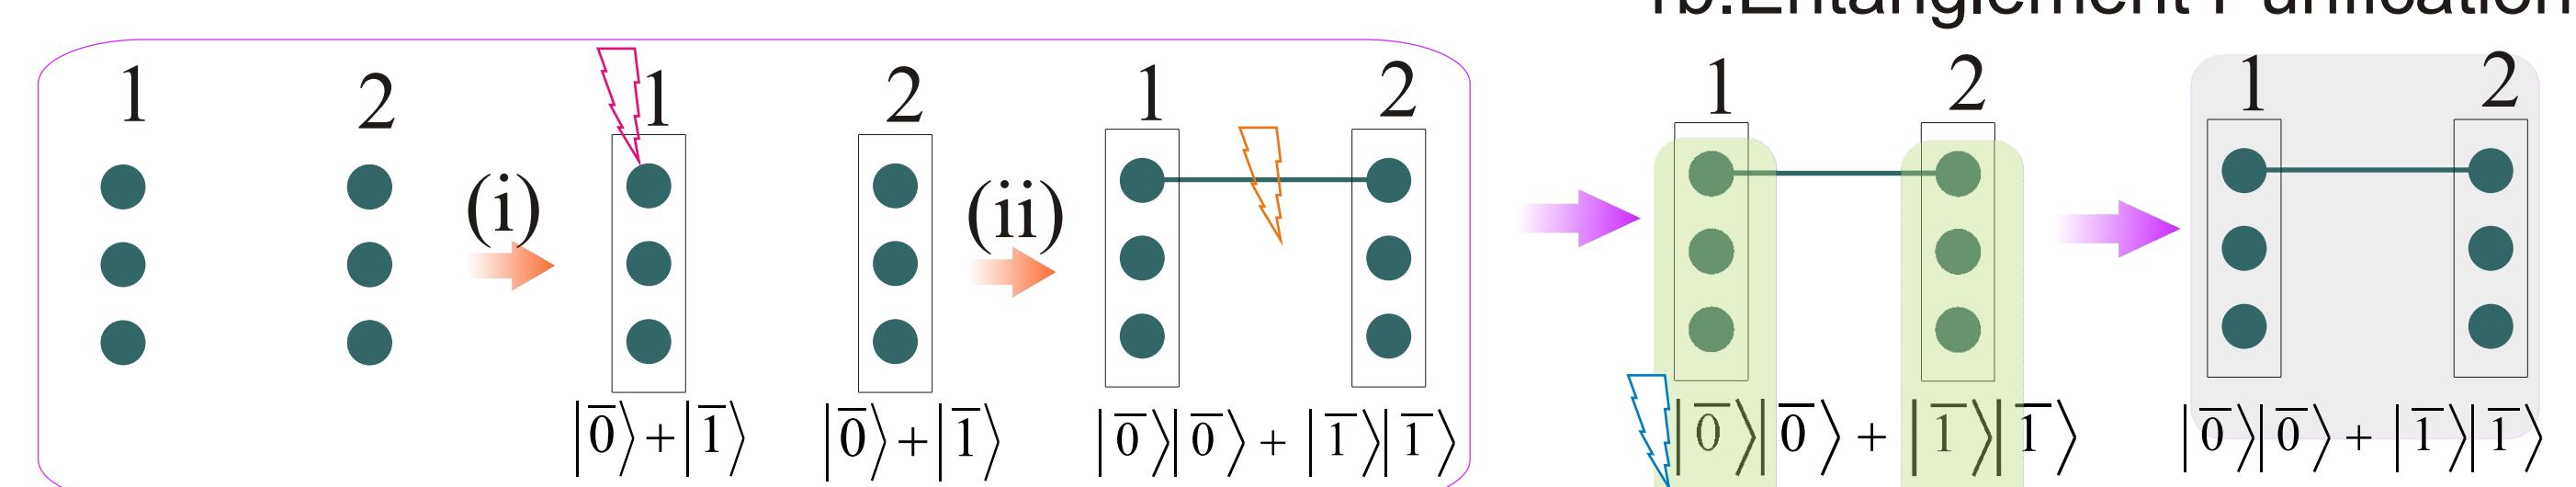

$$(1-q_g)^2 \rho' + q_g (1-q_g) (Z_i \rho' Z_i + X_j \rho' X_j) + q_g^2 Z_i X_j \rho' X_j Z_i$$

### 3. Imperfect memories

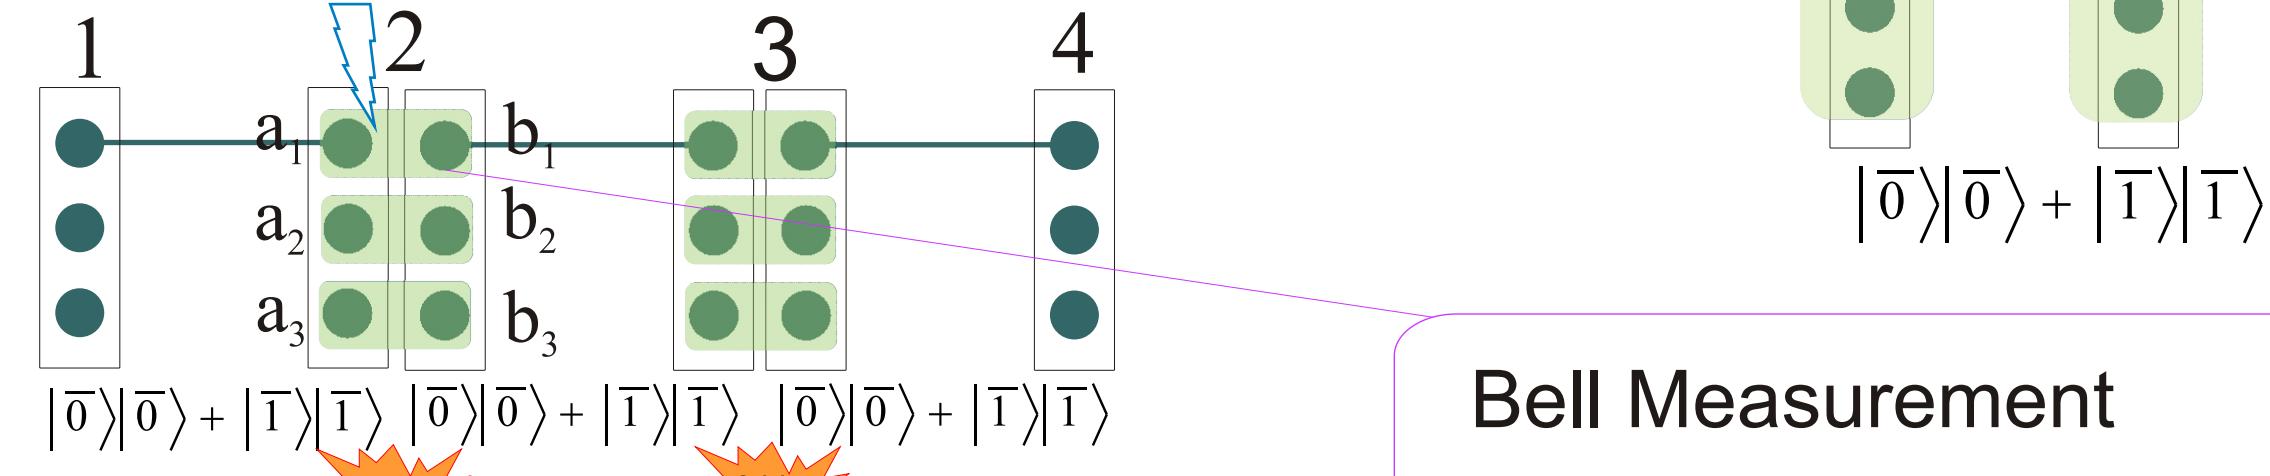

$$|\phi^\pm\rangle\langle\phi^\pm| \rightarrow (1-q_m(t))|\phi^\pm\rangle\langle\phi^\pm| + q_m(t)|\phi^\mp\rangle\langle\phi^\mp| \quad \text{with } q_m(t) = \frac{1-e^{-t/\tau}}{2}$$

## QUANTUM ERROR CORRECTION

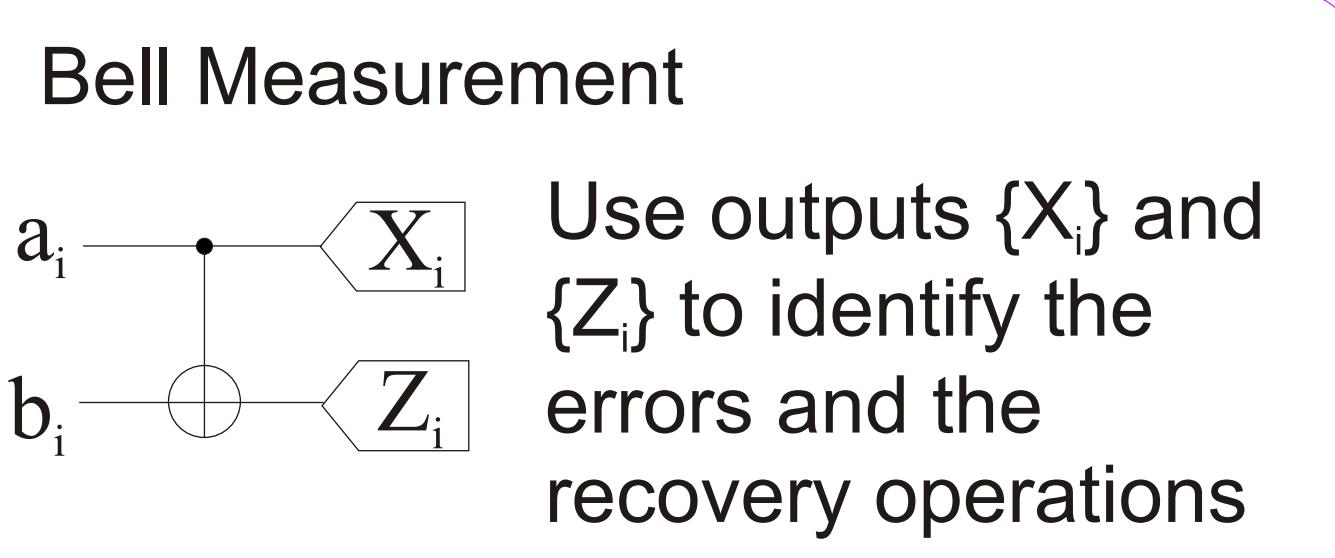

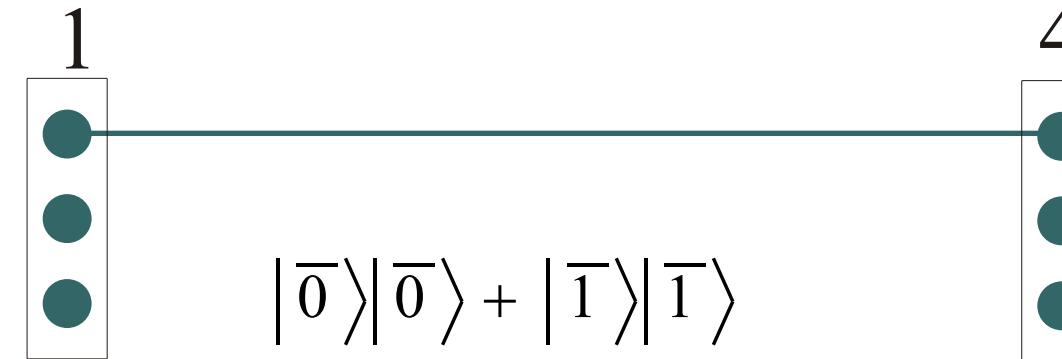

### 1. Encoded Generation

### 2. Encoded Connection

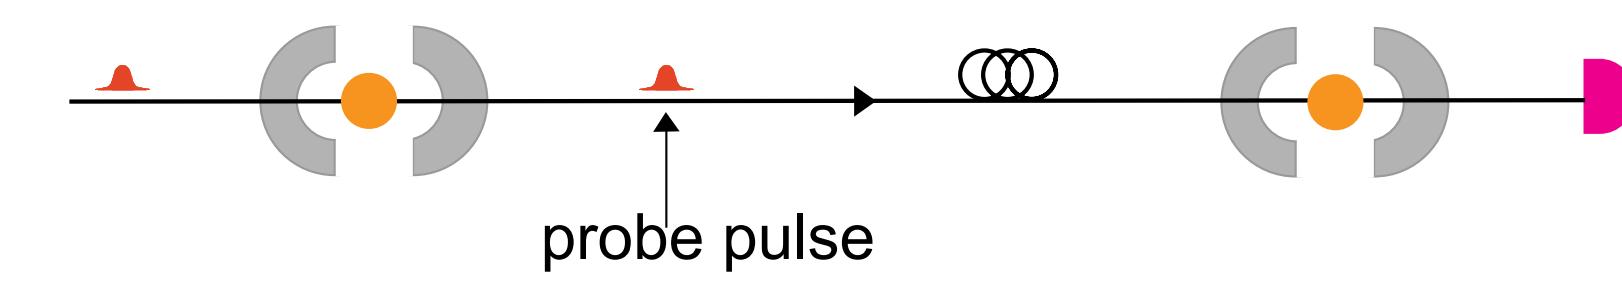

### 3. Pauli Frame

L. Jiang et al., PRA 79, 032325 (2009)

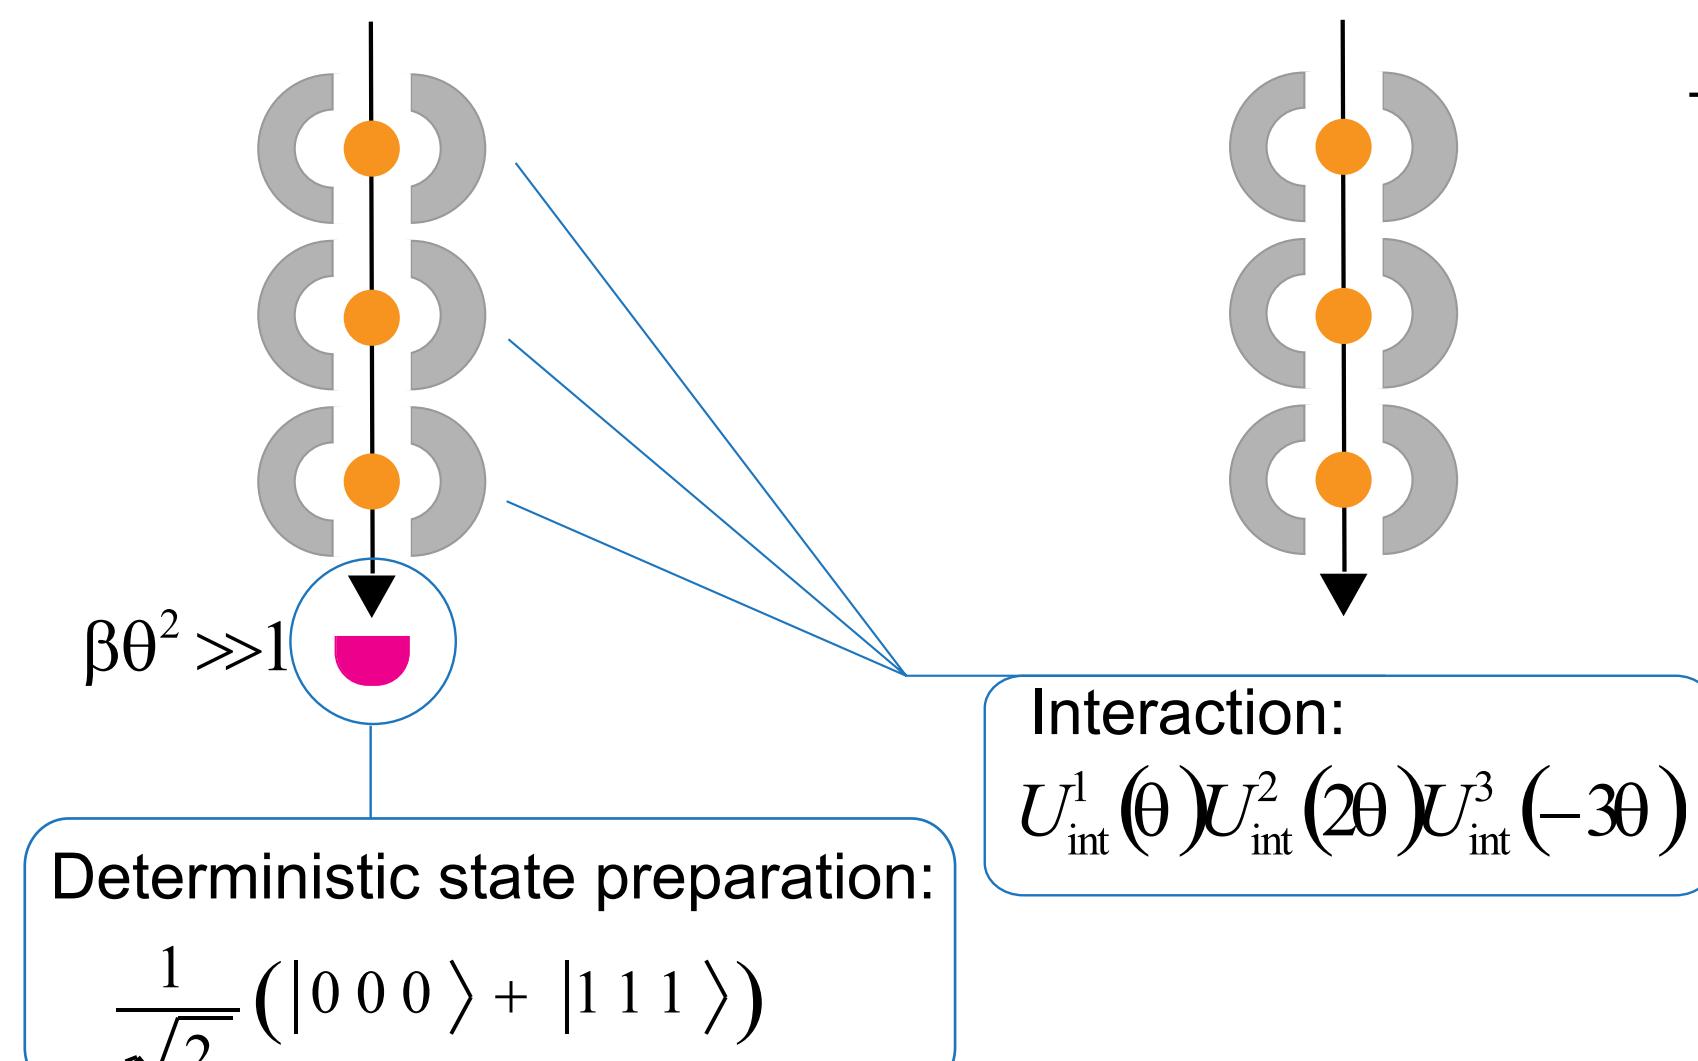

## IMPLEMENTATION

### 1. Non-encoded scheme

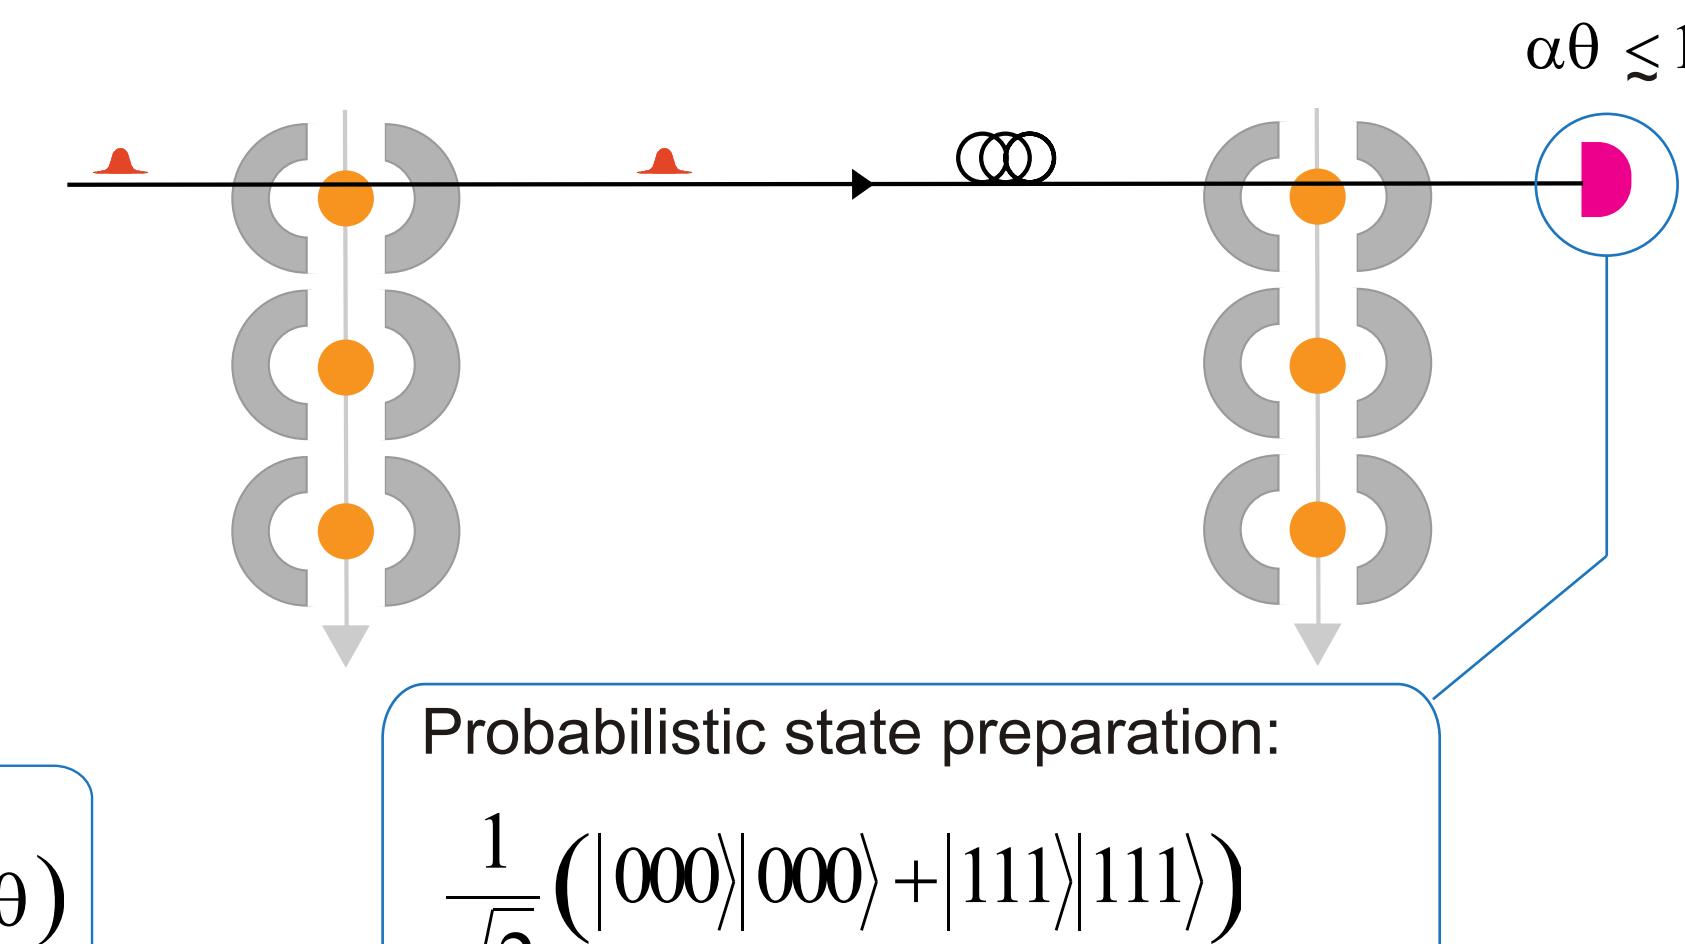

### 2. Encoded scheme

#### 2.1 Preparation of the local codeword states

#### 2.2 Distribution of an encoded pair

## RATE ANALYSIS

### Assumptions:

- unlimited initial resources
- optimal probabilistic entanglement generation
- deterministic swapping

### Errors and error suppression:

- imperfect generation of the entangled state
- local gate error
- imperfect memories
- purification and quantum error correction

→ Rate to successfully generate an entangled pair per memory using an [n,k,d] code:

Without purification:

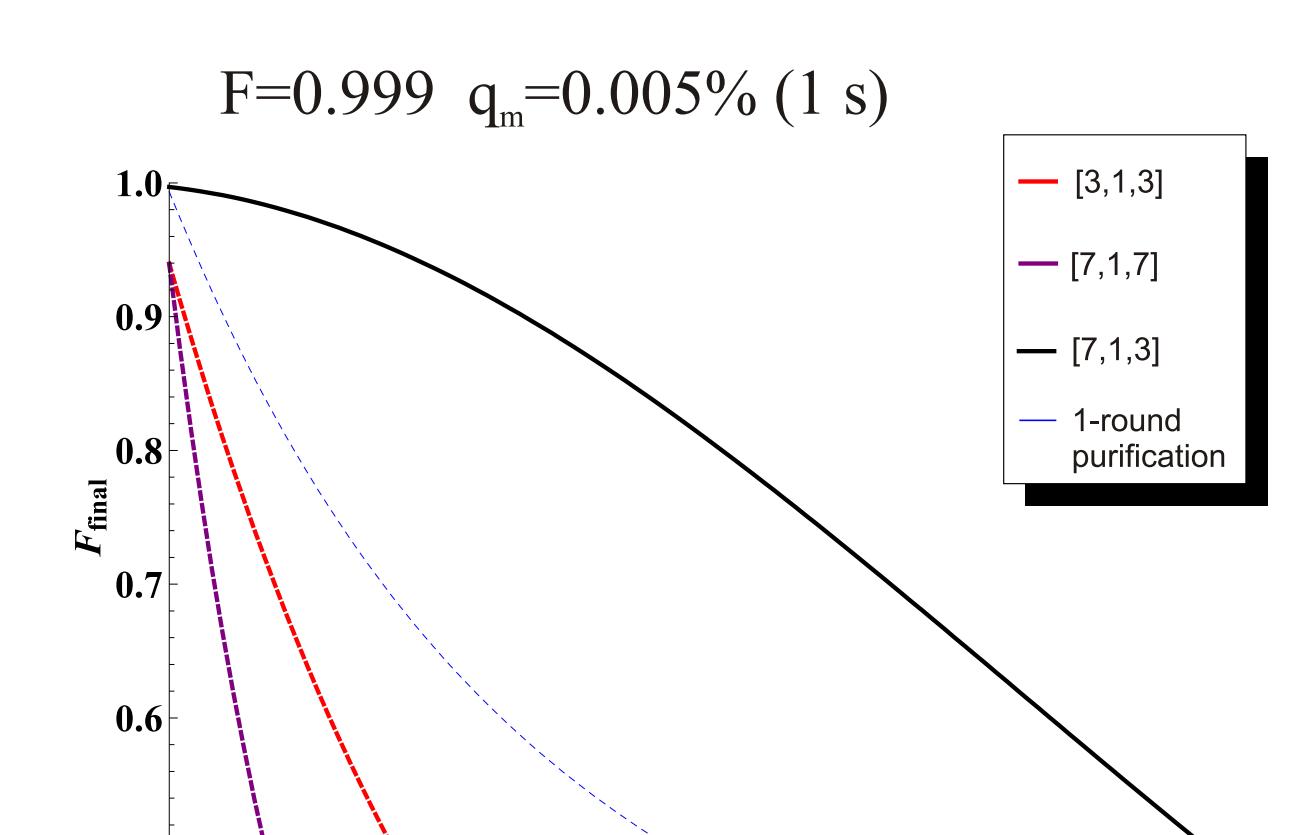

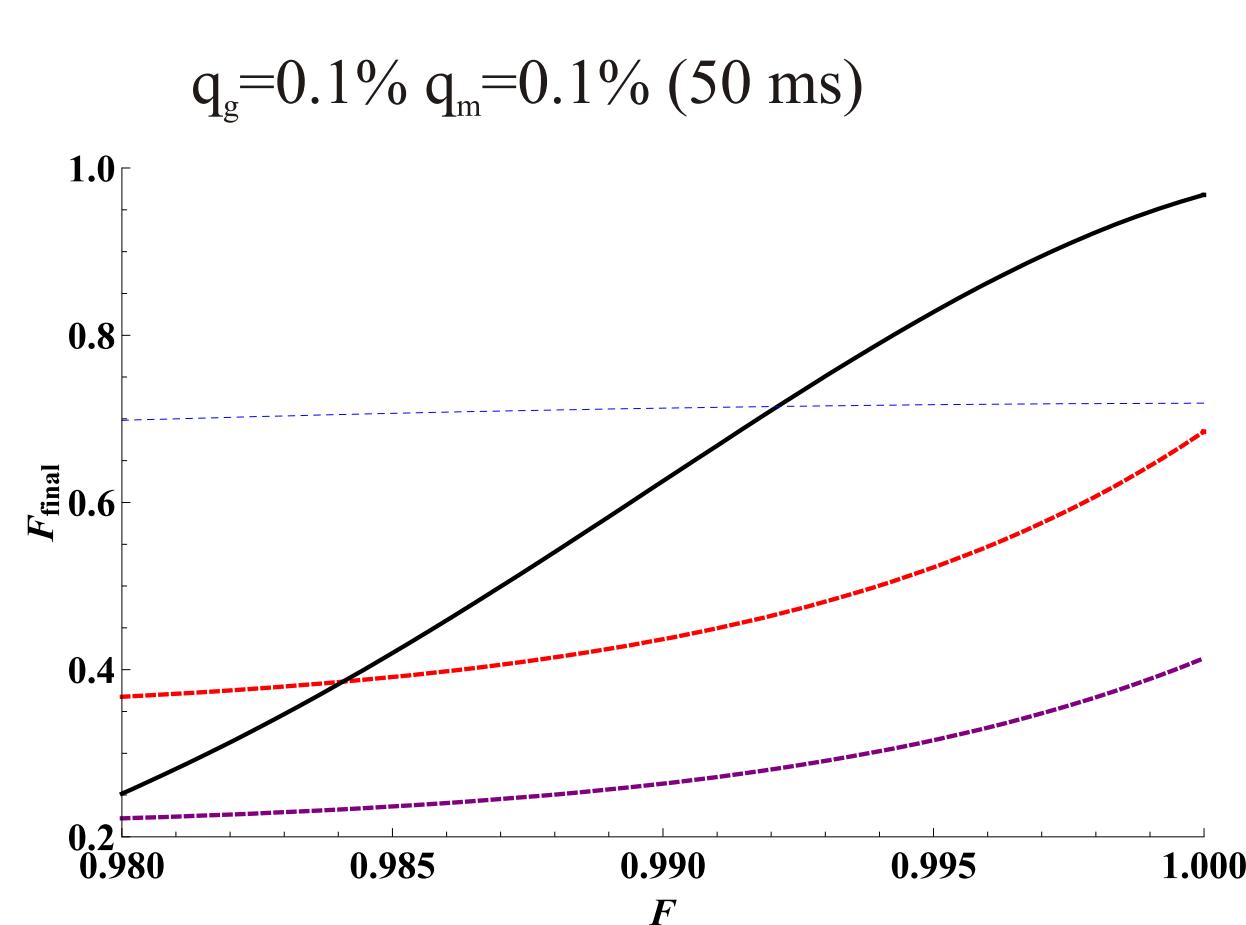

$$R = \frac{P_0}{nT_0}$$

With  $r$  rounds of purification:

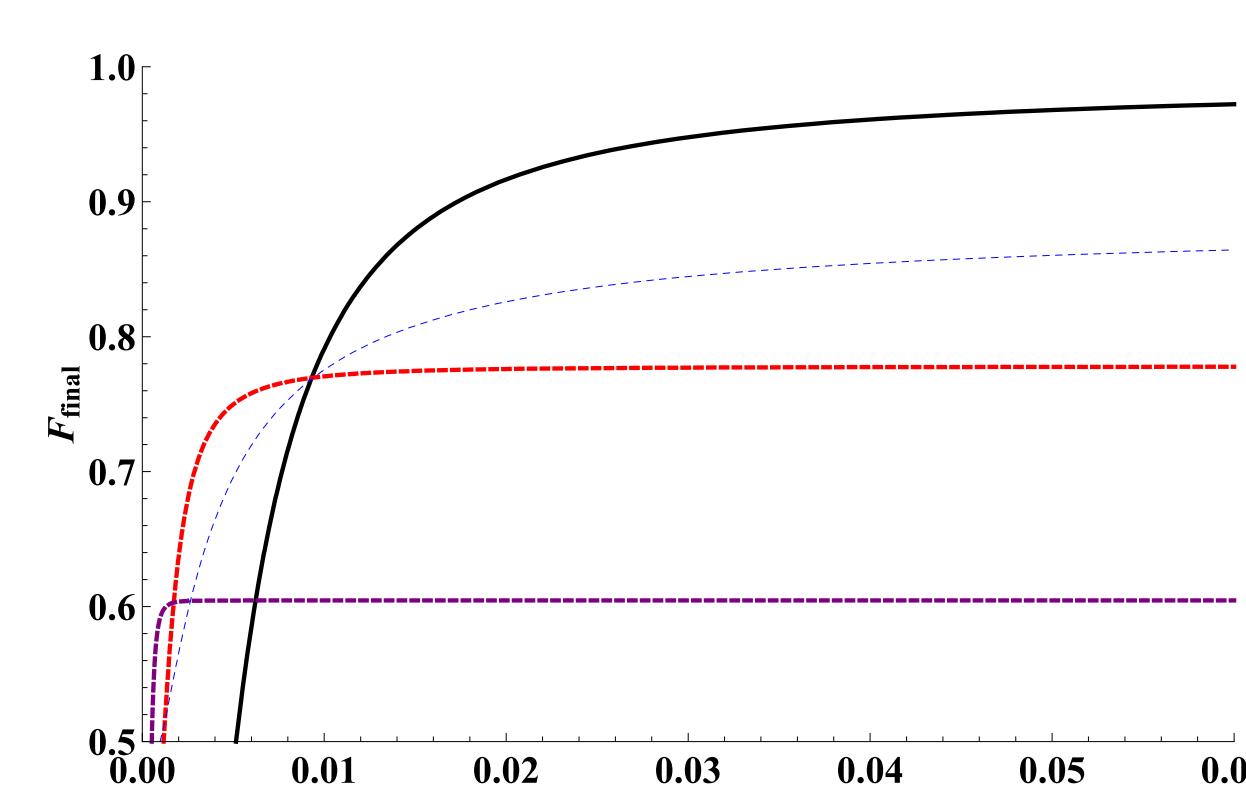

$$R_{pur,n} = \frac{P_0 P_r}{n 2^r (r/2+1) T_0}$$

## RESULTS

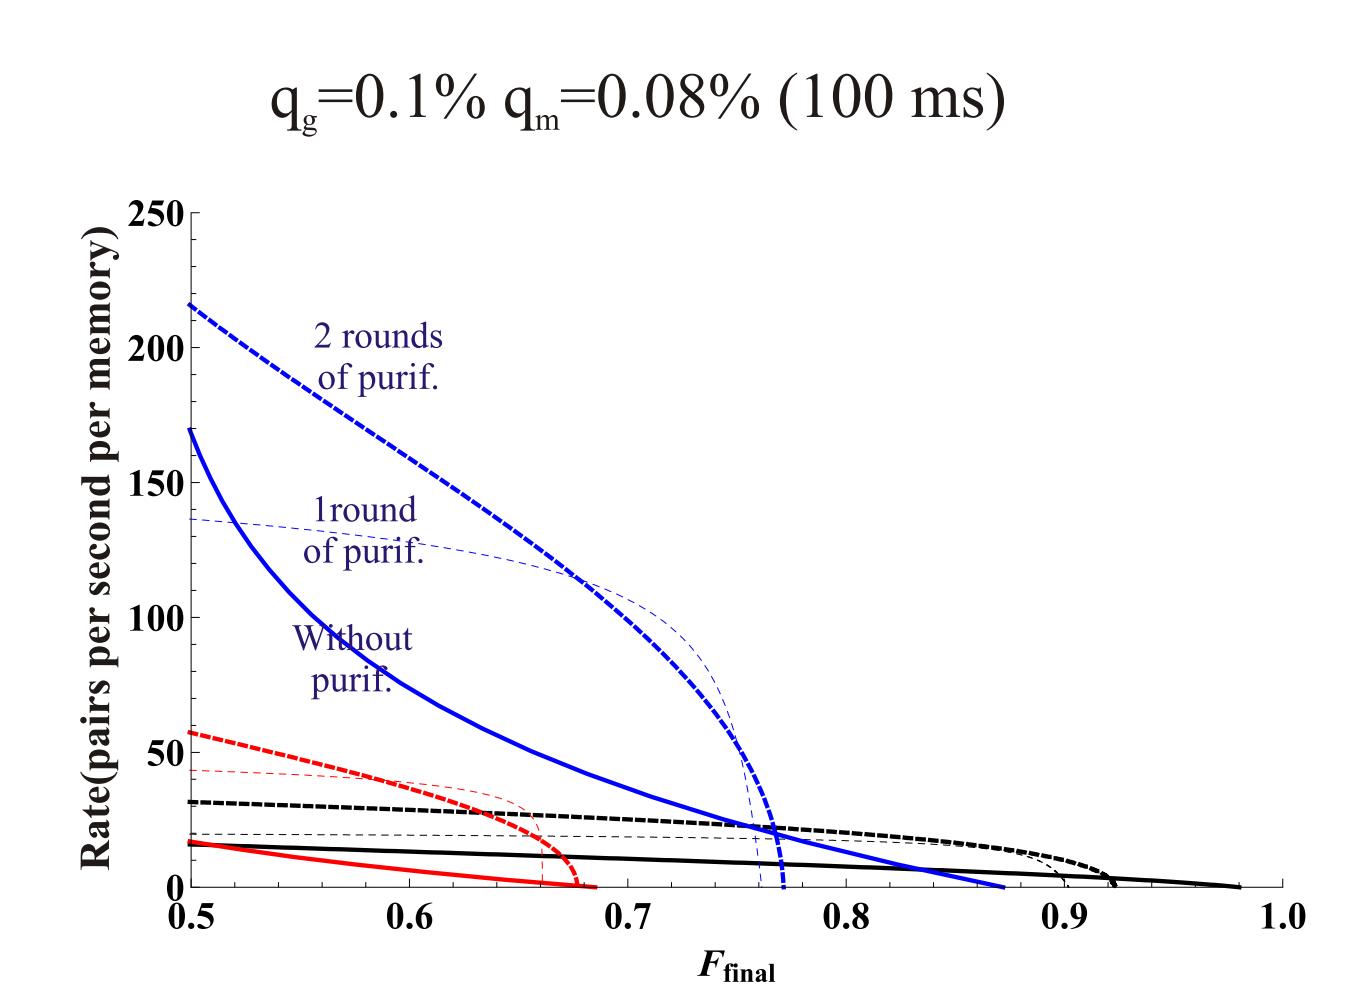

### Encoding versus Purification

$F=0.999 \quad q_g=0.05\%$

### Encoding+Purification

$q_g=0.1\% \quad q_m=0.08\% \quad (100 \text{ ms})$

Without encoding
